The following is among dissertations of the Leningrad Polytechnic Institute imeni Malinin:

"Impulse Generator for Feeding 15,000,000 Volts for an Electron Tube." 21 February 1947. Examination was made of methods of obtaining fast particles with the aid of high-voltage impulse generators. The possibilities of constructing an impulse generator are examined. The parameters of an impulse generator are calculated.

This collection of articles sums up the principal results of investigations and studies made by Prof. A. A. Gorev, Dr. Tech. Sci., and his staff in the field of high voltage phenomena and techniques at LPI (Leningrad Polytech Inst.) It was at this institute that Prof. Gorev completed his higher scientific education and then taught and carried on his investigations in the field until his death in 1955. In 1956, by decree of Min of Higher Education, the High-Voltage lab at LPI was named after A. A. Gorev.

TITLE: Honoring the 80th birthday of Mikhail Davidovich Kamenskiy

SOURCE: Izvestiya vysshikh uchebnykh zavedeniy. Energetika, no. 7, 1965, 130-131

TOPIC TAGS: electric power engineering, electric engineering personnel,
hydroelectric power plant, thermoelectric power plant

ABSTRACT: On 19 April 1965 Prof. Dr. Techn. Sci. Mikhail Davidovich Kamenskiy celebrated his 80th birthday and the 55th anniversary of his active work as a power expert. Mikhail Davidovich is a 1909 graduate of the Petersburg Polytechnic Institute - since his graduation he has been associated with this institute, now renamed Leningrad Polytechnic Institute, as an instructor. He is a major scientist and specialist in electric power grids and systems. He has been a major contributor to the establishment of the Leningrad Power Grid and various large thermal and hydro-

electric power stations and an active participant in the design and construction of high- and low-voltage power systems in many cities of the Soviet Union. During the Siege of Leningrad in World War II he was a member of the Municipal Party Defense Committee. Since the war Mikhail Davidovich has been head of the Chair of Electric Power Grids and Systems at the Leningrad Polytechnic Institute and has been working on the methods of calculating the economic regimes of power system operation and on the problems of the present-day development of urban power systems. M.D. Kamenskiy has published more than 80 works, including both original studies as well as textbooks that are popular in the Soviet Union and abroad. He is the chairman of the Section on Power Systems and Grids under the Leningrad Division of the Scientific and Technical Division of the Power Industry and organizer of and participant in many scientific-technical conferences and meetings. His merits as an educator of a new school of Soviet power engineers are equally large. Orig. art. has: 1 figure. [JPRS]

Title : The Effect of Colloids in Sugar Manufacture.
Orig Pub : Lekha promishlenost, 1956, 5, No 7, 27-29

Abstract : The approximate quantitative composition of colloidal components of beet roots is given. Utilization of the properties of individual colloids (C) for their separation from the juice is described (selection of technological conditions). Graphs are shown of the peptization of pectin substances depending on pH and temperature of the juice. Analytical procedures for determination of C in the juice are described. By laboratory methods a correlation has been ascertained between temperature of the juice during diffusion process and the final content of C therein.

TITLE: Magnetic amplification of lines and growth parameters of sunspots

SOURCE: Ref. zh. Astronomiya, Abs. 4.51.481

REF SOURCE: Visnyk Kyyivs'k. Un-tu. Ser. astron., no. 6, 1964, 25-31

TOPIC TAGS: ~~astrophysics~~, Sun, sunspot, solar radiation, solar magnetic field, solar spectral line

ABSTRACT: In one of their previous articles, the authors (Ref. zh. Astronomy, 1965, 5.51.375) investigated a sunspot observed June 22, 1959. In the presently referenced article, the same spot is studied, but at a different distance from the disk center. The spot was photographed June 27, 1959. The equivalent line widths W_{λ} have been corrected for halo influence and for magnetic amplification. The latter effect was evaluated on the basis of V. E. Stepanov's theory. In addition to published research, the same corrections are embodied in the W_{λ} values taken June 22 1959 and Sept. 19, 1958 on the sunspots (Ref. zh. Astron. 1962, 8A388). In the table below, the exciting temperature, T_B ; the number N of Fe I atoms in the field of view; the full velocity, v , and the turbulent velocity, v_t values are given for all three spots.

Orig Pub: Tezhka promishlenost, 1956, 5, No 9, 33-39

Abstract: Refractoriness of these clays varies between 1600 and 1720 . Shrinkage, water absorption and chemical composition have been determined. It was found that they are suitable for the production of semi-acidic refractories, and that individual varieties are also suitable for production of chamotte and high-grade refractories.

ORIG. PUP. : Lekha Prom-st, 1956, 7, № 14, 14-17

ABSTRACT : Paste composition formulas and manufacture methods have been developed for the production of "sanitary-technical articles (toilets, lavatories, etc.) from fireclay". In the course of experiments it was ascertained that shrinkage during drying of the work is less when the amount of fireclay is increased. Firing decreases with increasing amount of fireclay. The firing temperature of 1100-1150°C is attained on addition of 25-35% fireclay; to avoid extra shrinkage the fireclay must be fired 50-60°C higher than firing temperature of F. The quality of the articles is affected by particle size of fireclay; for thin-wall articles it is necessary to increase the amount of fine fraction. Experiments on replacement of

ORIG. PUB. :

ABSTRACT : added 0.1%, on brush-application of engobe -- 1.5% of carboxymethyl cellulose preparation "Tylose SL₆₀₀", which promotes thickening and prevents running of engobe down the vertical walls. Maximum thickness of engobe 2.5 mm; engobing is in multiple layers, zinc oxide being added to the last layer for better bonding between engobe and glaze; top layer can be applied as a mixture of equal parts of engobe and glaze. The articles are coated with a glaze of composition (in %): feldspar 50, dolomite 7, quartz sand 11, ZnO 6, SnO 4, kaolin 4, porcelain body 12, frit 6; glaze and engobe have same coefficient of thermal expansion and air-shrinkage. In glazing, 1.5% carboxymethyl cellulose

Abstract [author's Russian and English summaries, modified]: A brief review of the literature on cerebral arteriography in children, and a discussion of the author's own observations in 21 children, including 13 cases of carotid arteriography and 8 cases of subclavical arteriography. In children subclavical arteriography is found to be more suitable for arteriography of the vertebo-basillary system. One Bulgarian and 7 Western references. Manuscript received in Apr 65.

TITLE: The use of nuclear emulsions in electronic microscopy

PERIODICAL: Referativnyy zhurnal. Fizika, no. 7, 1961, 12, abstract 7A16⁴ ("Tr. Vses. n.-i. kinofotoin-ta", 1959, no. 32, 68 - 72)

TEXT: MK-type microradiographical photoplates are recommended for photographing electron-microscopic images with low magnification, if a considerable subsequent magnification is required. The resolving capacity of these plates (320 l/mm) excels about 4.5 times that of electronographical plates (70 l/mm) due to scattering of electrons in the photoemulsion, arise, since the size of the circle of electron scattering in the emulsion thin layer does not exceed dimensions of its grains. If a high sensitivity of photomaterials is required, photo plates of MP (MR)-type are recommended.

TITLE: Microclimate of vineyards on cascade cultures over southward slopes

SOURCE: Idojaras, no. 6, 1964, 334-342

TOPIC TAGS: meteorology, climatic condition, microclimatology, climatic influence

ABSTRACT: [Russian article; authors' Hungarian summary, abbreviated] The effects of cascade-strip cultivation on vineyards over southern slopes located in an anti-cyclonic weather zone at a Northern latitude of $42^{\circ}25'$, altitude over sea level of 150 m., and a slope of 14° , upon the microclimate were investigated. The differences between cascade-strip and non-cascadic cultivation were significant and the cross-section of the cascades was also influential. The differences and the factors responsible for these were discussed. Orig. Art. Incl.: 11 tables.
